

# Planting Guide

Dig a hole for each plant (1-2ft apart). The width of your hole should be about twice the diameter and the same height of the root ball of the plant.

Gently remove the plant from its container, and place the plant in the hole. It's very important to place the plant deep enough in the hole so that the roots are not exposed.

Fill the hole with the original soil. Gently pack the soil to remove any trapped air. Last, but not least, water!

After planting, keep your plants well watered for the first year to establish a good root system.
